Office Action Summary

Art Unit: 2834

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims, 5-13 and 17-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Matanaka in view of Gore.

Matanaka (figs. 2, 9, 26 and 27) teaches a multi layer ceramic package with a piezo element mounted in a cavity and protected by a cover on one side of substrate while an IC chip is formed on the opposite side of the substrate. Lead electrodes are taken out of the package on the same side as the IC chip is mounted. The IC chip and other components are encapsulated. A structure which includes the output electrodes projects beyond the IC and components, providing the necessary stand-off so that this side can be mounted to a printed circuit board. Solder balls are not explicitly used to connect the structure to the PCB. However, Gore (fig. 8), explicitly teaches using solder balls to both stand-off and electrically couple an electronic package to a printed circuit board. This allows connections to be made either by reflow soldering or ultrasonic bonding to form strong, mechanical and electrical and electrical connections. Thus at least those reasons it would have been obvious to one of ordinary skill in the art to use solder balls as e.g. #11a, #11b in Hatanaka.

Further cited of interest are Fukiharu and Yatsuda.
